Notes on Stochastic Finance

N. Privault

914

This version: March 18, 2019
http://www.ntu.edu.sg/home/nprivault/index.html

This book is an introduction to the pricing and hedging of financial derivatives, including vanilla and exotic options, by stochastic calculus and partial differential equation methods. The presentation is done both in discrete and continuous-time financial models, with an emphasis on the complementarity between algebraic and probabilistic methods. In particular it covers the pricing of some interest rate derivatives, of American options, of exotic options such as barrier, lookback and Asian options, and stochastic models with compound Poisson jumps. The text is accompanied with a number of figures and simulations, and includes 20 examples based on actual market data. The concepts presented are illustrated by examples and by 183 exercises and 10 problems with their complete solutions.
