Notes on Financial Risk and Analytics

This version: January 15, 2020
https://www.ntu.edu.sg/home/nprivault/index.html
Preface

The topics covered in these notes include an introduction to stochastic modeling with discrete-valued stochastic processes, a basic coverage of Value at Risk and expected shortfall, as well as structures of random dependence. Various types of risk Gourieroux and Jasiak (2001) can be classified into market risk, liquidity risk, credit risk, counterparty risk, model risk, estimation risk. For insurance businesses, a more detailed classification can be set as follows.

a) Financial risk
   - Investment risk
     - Credit risk,
     - Market risk \((e.g.\) depreciation),
     - Counterparty risk.
   - Liability risk
     - Catastrophe risk,
     - Non-catastrophe risk \((e.g.\) claim volatility).

b) Operational risk
   - Business risk \((e.g.\) lower production),
   - Event risk \((e.g.\) system failure).

Financial, investment, market and non-catastrophe risks are covered in Chapters 1, 3 and 4 on time series, Value at Risk and expected shortfall.

Credit risk is covered in Chapters 6, 7 and 8 on the structural and reduced-form approaches to credit risk and valuation, which require a basic knowledge of stochastic calculus in continuous time. Credit default is treated via defaultable bonds, Credit Default Swaps (CDS) and collateralized debt obligations (CDOs).

Chapter 9 is devoted to credit scoring, using discriminant analysis and logistic regression. Liability, catastrophe and operational risks such as business or event risk are covered in Chapter 2 on risk theory. Basic risk Theory and
credit scoring are presented with illustrative examples in R.

This material has been used for teaching in the Masters of Science in Financial Engineering (MFE) and in Analytics (MSA) at the Nanyang Technological University in Singapore. The pdf file contains external links and 90 figures, including 2 animated figures that may require using Acrobat Reader for viewing on the complete pdf file.

This text also includes 41 exercises with solutions. Clicking on an exercise number inside the solution section will send to the original problem text inside the file. Conversely, clicking on the problem number sends the reader to the corresponding solution, however this feature should not be misused.

Nicolas Privault

Contents

1 Time Series .......................................................... 1
  1.1 Autoregressive Moving Average (ARMA) ....................... 1
  1.2 Autoregressive Integrated Moving Average ................... 7
  1.3 Time Series Stationarity ....................................... 10
  1.4 Fitting Time Series to Financial Data ....................... 16
  1.5 Application: Pair Trading .................................... 19
Exercises ............................................................. 26

2 Insurance Risk ..................................................... 29
  2.1 The Poisson Process ........................................ 29
  2.2 Compound Poisson Process .................................. 37
  2.3 Claim and Reserve Processes ............................... 42
  2.4 Ruin Probabilities .......................................... 43
Exercises ............................................................. 49

3 Value at Risk ...................................................... 51
  3.1 Financial Data with R ....................................... 51
  3.2 Risk Measures ............................................... 52
  3.3 Quantile Risk Measures .................................... 55
  3.4 Value at Risk (VaR) ......................................... 59
Exercises ............................................................. 66

4 Expected Shortfall ................................................ 69
  4.1 Tail Value at Risk (TVaR) ................................... 69
  4.2 Conditional tail expectation (CTE) .......................... 70
  4.3 Expected Shortfall (ES) ..................................... 74
  4.4 Gaussian Measures of Risk vs Market Returns ............... 81
Exercises ............................................................. 85

3.3 Estimating liabilities by a conditional mean over 346 returns ........ 53
3.4 Gaussian Cumulative distribution function* ........................... 56
3.5 Cumulative distribution function with jumps* ....................... 57
3.6 Gaussian quantile $q_p^Z = 1.644854$ at $p = 0.95$ ................. 57
3.7 Exponential quantile $q_p^X = 2.995732$ at $p = 0.95$ ............... 58
3.8 Example of quantiles given as percentiles .......................... 58
3.9 Empirical cumulative distribution function ............................ 59
3.10 Symmetric and nonsymmetric VaR ................................. 62
3.11 Cumulative distribution function ................................. 63
3.12 Cumulative distribution function ................................. 64
3.13 Cumulative distribution function ................................. 67

4.1 Two distributions having the same Value at Risk $V_X^{95\%} = 2.145$ .... 69
4.2 Value at Risk and Conditional Tail Expectation ........................ 73
4.3 Value at Risk and Expected Shortfall ................................. 80
4.4 Value at Risk vs Expected Shortfall ................................ 80
4.5 Market returns vs normalized Gaussian returns ...................... 81
4.6 Empirical density vs normalized Gaussian density .................. 82
4.7 Empirical density vs power density ................................ 82
4.8 Historical vs Gaussian estimates of Value at Risk .................. 83
4.9 Quantile function ...................................................... 84
4.10 Cumulative distribution function ...................................... 86
4.11 Cumulative distribution function ...................................... 87

5.1 Joint Gaussian probability density ....................................... 91
5.2 Different Gaussian copula graphs ..................................... 96
5.3 Different Gaussian copula density graphs ............................ 97
5.4 Samples with uniform marginals and given copulas ................ 99
5.5 Samples with Gaussian marginals and given copulas ............... 100
5.6 Joint densities with Gaussian marginals and given copulas ......... 100
5.7 Joint density contour plots with Gaussian marginals and given copulas 101
5.8 Samples with exponential marginals and given copulas ............ 102
5.9 Truncated two-dimensional Gaussian density ....................... 103

6.1 Function $x \mapsto \Phi(\Phi^{-1}(x) + (\mu - r)\sqrt{T-t}/\sigma)$ ................. 108

8.1 A representation of CDO tranches ................................. 138
8.2 A Titanic-style representation of cumulative tranche losses .......... 139
8.3 Function $f_k(x) = \min((x - N\alpha_{k-1})^+, Np_k)$ .................. 141
8.4 Internal Ratings-Based formula .................................... 143

9.1 Probability default curve $x \mapsto \mathbb{P}(B \mid X = x)$ .................. 151
9.2 Probability acceptance curve $x \mapsto \mathbb{P}(G \mid X = x)$ ............ 152
9.3 Animated graph of optimal decision rule* .......................... 155
9.4 Logistic function ....................................................... 157
9.5 Logistic regression output on 5 criteria ........................... 158
Notes on Financial Risk and Analytics

9.6 Logistic regression output on 61 criteria ........................................... 159
9.7 Gaussian ROC curves ........................................................................ 161
9.8 ROC curves based on 5 criteria and 61 criteria .................................. 162
10.9 Probability computed as a volume integral ........................................ 178

S.1 Pareto cumulative and probability density functions ............................ 207
S.2 Cumulative distribution function ....................................................... 208
S.3 Value at Risk and Expected Shortfall for small data .......................... 211
S.4 Cumulative distribution function ....................................................... 212
S.5 Cumulative distribution function ....................................................... 213
S.6 Cumulative distribution function ....................................................... 213
S.7 Exponential copula function $u, v \mapsto C(u, b)$ ................................... 217
S.8 Survival copula graph ......................................................................... 221
S.9 Survival copula density graph ........................................................... 222
S.10 Cashflow data .................................................................................. 230
S.11 CDS price data ................................................................................ 231
S.12 CDS data ......................................................................................... 232

* Animated figures (work in Acrobat Reader).
