

Joint PhD Program Description

The description for the Joint PhD program will be posted online as a sub-page to

[Joint/Dual PhD Programmes | Graduate College | NTU Singapore.](#)

Name of Partner University	Shanghai Jiao Tong University
Country	China
Year of JPP Establishment	2022
Program	<input checked="" type="checkbox"/> Joint Degree <input type="checkbox"/> Joint Supervision
Description of the Program (150-250 words)	<p>The NTU-SJTU joint PhD degree program is newly launched in 2022 to provide students with an excellent opportunity to study in an interdisciplinary, international and multicultural environment. Areas of research include Science, Engineering, Management, Computing and Social Sciences.</p> <p>Students are expected to fulfil a residency or period of attachment between a minimum of 12 months to a maximum of 24 months at the Partner Institution.</p>
Disciplines	All disciplines, but not limited to carbon utilization and sustainability, e.g., chemistry, chemical engineering, material science, environmental science and engineering, human-computer interaction, brain-computer interfaces, computer vision, visual analytics, medical computing, artificial intelligence, chemical biology, immunology, and microbiology.
PMC Names	NTU: K Jimmy Hsia, Liu Hong SJTU: Deng Tao, Xuemin (Lisa) Xu
PMC Emails	NTU: kjhsia@ntu.edu.sg ; liuhong@ntu.edu.sg SJTU: dengtao@sjtu.edu.cn ; lisaxu@sjtu.edu.cn

Joint Projects

Project Title	Chemical transformation of waste carbon resources to value-added products	
Project Description (200-300 words)	<p>Global warming is the greatest existential challenge of the present century. As part of the effort to mitigate global warming, the transition from conventional fossil-fuel based value chains to renewable and sustainable value chains is essential. To this end, this program aims for cutting-edge research on the utilisation of waste carbon resources (CO₂, biomass, etc.) to produce value-added functional products high potential for impact. Targeting at renewable fuels, chemicals and materials transformed from renewable, abundant and widely-available waste carbon resources, the program is dedicated to mitigating the carbon footprints and negative environmental impacts of the chemical industry, as well as to enhance the economic competitiveness of waste carbon valorisation processes through novel catalyst development and reaction design towards commercial viability.</p> <p>Candidates interested in the joint program are advised to contact either the SJTU (Dr Xi Chen, chenxi-lcc@sjtu.edu.cn) or NTU (Dr Wen Liu, wenliu@ntu.edu.sg) supervisors for additional information on the project as well as admission requirements.</p>

Project Title	Impact of the gut microbiota on host gut biology	
Project Description (200-300 words)	<p>The Qiao lab (NTU) and Hu lab (SJTU) jointly explore the impact of gut microbiota composition and metabolites on host gut immunology. While numerous studies have demonstrated the essential roles of the gut microbiota on human health, the detailed mechanistic understanding of how the gut microbiota affects host health at the molecular level is far from clear. To answer such complex questions, the two labs will join forces to build a multidisciplinary program, where the Qiao lab focuses on the analytical and chemical microbiology aspects to elucidate the structures and develop chemical probes of the gut microbiota metabolites, and the Hu lab has expertise on gut immunology and animal models. The joint projects will elucidate mechanisms of gut microbiota metabolites on host gut immunology and function from both in vitro and in vivo aspects.</p> <p>The candidate will apply analytical chemistry and synthetic chemistry to study the gut microbiota-derived metabolites (Qiao lab), and specifically address the bioactivity and signalling pathways of such metabolites in vitro and in vivo in mice models (Qiao and Hu lab). The candidate will receive holistic training in chemical microbiology and immunology areas and have opportunities to work closely with both teams.</p>

Project Title	Robust Speech Recognition with Large Language Model	
Project Description (200-300 words)	The research topics will be centred around robust speech recognition with focus on the exploitation of large language models. Existing ways to exploit this include: adaptation, fine-tuning for targeted tasks and domain, reuse of LLM's trained models, distillation to get smaller models. Recently, there is also the use of LLM to perform generative correction of N-best decoding. The results have been surprising and shows a new paradigm to perform error correction.
